

To perform the steps outlined in the previous answer using Git commands, you can use the following:

Create a Git repository on your local machine:

```
$ git init
```

Stage and commit changes:

```
$ git add .
```

```
$ git commit -m "Initial commit"
```

¹

Create a new repository on GitHub and push your local repository to it:

```
$ git remote add origin https://github.com/asmafirdous/CAPSTONE-PROJECT
```

```
$ git push -u origin master
```

Continuously monitor and update the model:

```
$ git pull
```

```
$ git add [modified files]
```

```
$ git commit -m "Updated model"
```

```
$ git push
```
